Testing of Hypothesis – F- Test and ANOVA – Practice Problems

1. A sample of size 13 gave an estimated population variance of 3.0, while another sample of size 15 gave an estimate of 2.5. Could both samples be from populations with the same variance?

2. Two independent samples of 8 and 7 items respectively had the following values of the variable.

$$
\begin{array}{llllllllll}
\text{Sample 1:} & 9 & 11 & 13 & 11 & 15 & 9 & 12 & 14 \\
\text{Sample 2:} & 10 & 12 & 10 & 14 & 9 & 8 & 10
\end{array}
$$

Do the two estimates of population variance differ significantly at 5% LOS?

3. Four treatments for fever blisters, including a placebo (A), were randomly assigned to 20 patients. The data below show, for each treatment, the numbers of days from initial appearance of the blisters until healing is complete. (Use 5% LOS)

Treatment	Number of days				
A	5	8	7	7	8
B	4	6	6	3	5
C	6	4	4	5	4
D	7	4	6	6	5

Test the hypothesis, at the 5% significance level, that there is no difference between the four treatments with respect to mean time of healing.

4. The following data give the lifetimes, in hours, of three types of battery.

Type	I	50.1	49.9	49.8	49.7	50.0
	II	51.0	50.8	50.9	50.9	50.6
	III	49.5	50.1	50.2	49.8	49.3

Analyse these data for a difference between mean lifetimes. (Use a 5% significance level.)

5. Three different brands of magnetron tubes (the key component in microwave ovens) were subjected to stress testing. The number of hours each operated before needing repair was recorded.

Brand	A	36	48	5	67	53
	B	49	33	60	2	55
	C	71	31	140	59	224

Although these times may not represent lifetimes, they do indicate how well the tubes can withstand stress. Use analysis of variance procedure to test the hypothesis that the mean lifetime under stress is the same for the three brands. (Use 0.01 LOS)

Table of F (Variance ratio)—1 Per Cent Points * $(0.01 \ LOS)$
